SCHOOLTHREATMITIGATION

FROM SPECIFIC THREATS TO VERIFIED COUNTERMEASURES

Mass-shooting prevention · lawful protection · accountable response
Public defensive engineering proposal | 26 October 2026

VERSION 17.0

ONE INTEGRATED PROTECTION SYSTEM

G0 constitutional safeguards govern every activity, including technology and human response.

G0 / CONSTITUTIONAL AUTHORITY & PUBLIC TRUST

Due process · FERPA minimization · independent complaints · no owner registry

PREVENT

Youth firearm access

ASSESS

Corroborate behaviors

PROTECT

Alerts · safe egress

RESPOND

Qualified professionals

LEARN

Validated improvements

Recheck threats, failures, rights impacts and evidence after every exercise or material change.

CLASSIFY THREATS BEFORE BUYING TECHNOLOGY

Four scenario families organize the specific requirements in the V17.0 register.

01 PRE-INCIDENT ACCESS

Unsecured household / vehicle firearm
Voluntary secure-storage controls and caregiver education

02 ESCALATION SIGNAL

Corroborated threat, false allegation or synthetic media
Multidisciplinary review and lawful intervention

03 IMMEDIATE DANGER

Verified warning, ambiguous alarm, disabled egress
Human-authorized alerts, safe shelter/exit and EMS

04 SECONDARY FAILURE

Ransomware, power loss, misidentification or data leak
Manual fallback, incident oversight, recover and remediate

PREVENT ACCESS WITHOUT REGISTERING OWNERS

Start upstream, before protective security systems are needed.

HOUSEHOLD & VISITOR SAFETY

Voluntary locked and unloaded storage
Secure keys / combinations
Vehicle and other-household awareness
Lawful temporary storage referral

NON-NEGOTIABLE RIGHTS

No school firearm-owner list
No mandatory ownership disclosure
No inference from lawful ownership
No coercion or marketing of family data

MEASURE: opt-in reach, comprehension, affordable access and anonymized practice changes.

THREATS DRIVE TECHNOLOGY ADOPTION

Rapid co-evolution requires rapid learning—but not uncontrolled life-safety deployments.

01

THREAT

Observed facts, credible emerging evidence

02

GAP

Compare baseline and non-tech alternatives

03

TEST

Independent safety / false-alarm studies

04

DEPLOY?

Authorize, limit, revise or retire

CYBERSECURITY IS LIFE SAFETY: signed updates · MFA · isolation · manual fallback · recovery.

CORROBORATE SIGNALS / PRESERVE DUE PROCESS

A report is an input to fact-finding, not a guilty verdict.

INTAKE

Document observable facts and provenance.
Protect complainants.
Separate anonymous tips from findings.

HUMAN REVIEW

Corroborate and seek context.
Consider supportive interventions.
Retain exculpatory evidence.

LAWFUL ACTION

Proportionate and documented.
Appropriate emergency exception only.
Correction, appeal and oversight.

NEVER: police escalation or an AI danger label solely from protected speech or uncorroborated allegation.

PROTECT STUDENTS WITHOUT TRAPPING THEM

Every protective feature must pass fire, accessibility and power-failure review.

PHYSICAL PROTECTION

Controlled entry and maintainable door hardware
Accessible protective actions
No unsanctioned barricade/lock-in
Emergency access where required

FAILURE TESTS

Safe release under power loss
Multimodal understandable alert
Accessible response for disabilities
Qualified building/fire review

STOP: an occupied exit that cannot be opened, or a safety system that can be remotely misused.

QUALIFY SPECIALIST RESPONSE

No canine, security, sensor or AI system is automatically validated by inclusion.

CANINES / LIMITED-SCOPE TESTING

Define one screening function.
Credential both dog and handler.
Double-blind independent efficacy tests.
Protect student welfare and lawful search rules.

AUTHORIZED RESPONSE / GOVERNANCE

Qualified, separately authorized personnel.
Clearly documented law-enforcement coordination.
Identification, force oversight and accountability.
No AI-initiated or software-delegated force.

Do not publish operational armed-response details or site-specific defensive weaknesses.

AI AND CYBERSECURITY: HIGH PROMISE, HIGH ASSURANCE

AI supports staff; it never owns coercive or life-and-death decisions.

LOW-RISK PILOTS

Translation, de-identified research and maintenance

SENSOR VALIDATION

Measure misses, false alarms, spoofing and domain shift

SYSTEM RESILIENCE

MFA, segmentation, backups, patching and manual recovery

PROHIBITED: automated student danger scoring, automatic suspect identity, autonomous confinement or use of force.

PUBLIC TRUST IS A SAFETY REQUIREMENT

Constitutional limits and independent review enable voluntary participation.

AUTHORITY

Document legal grounds and agency roles

DATA FIREWALL

FERPA purpose and redisclosure limits

COMPLAINTS

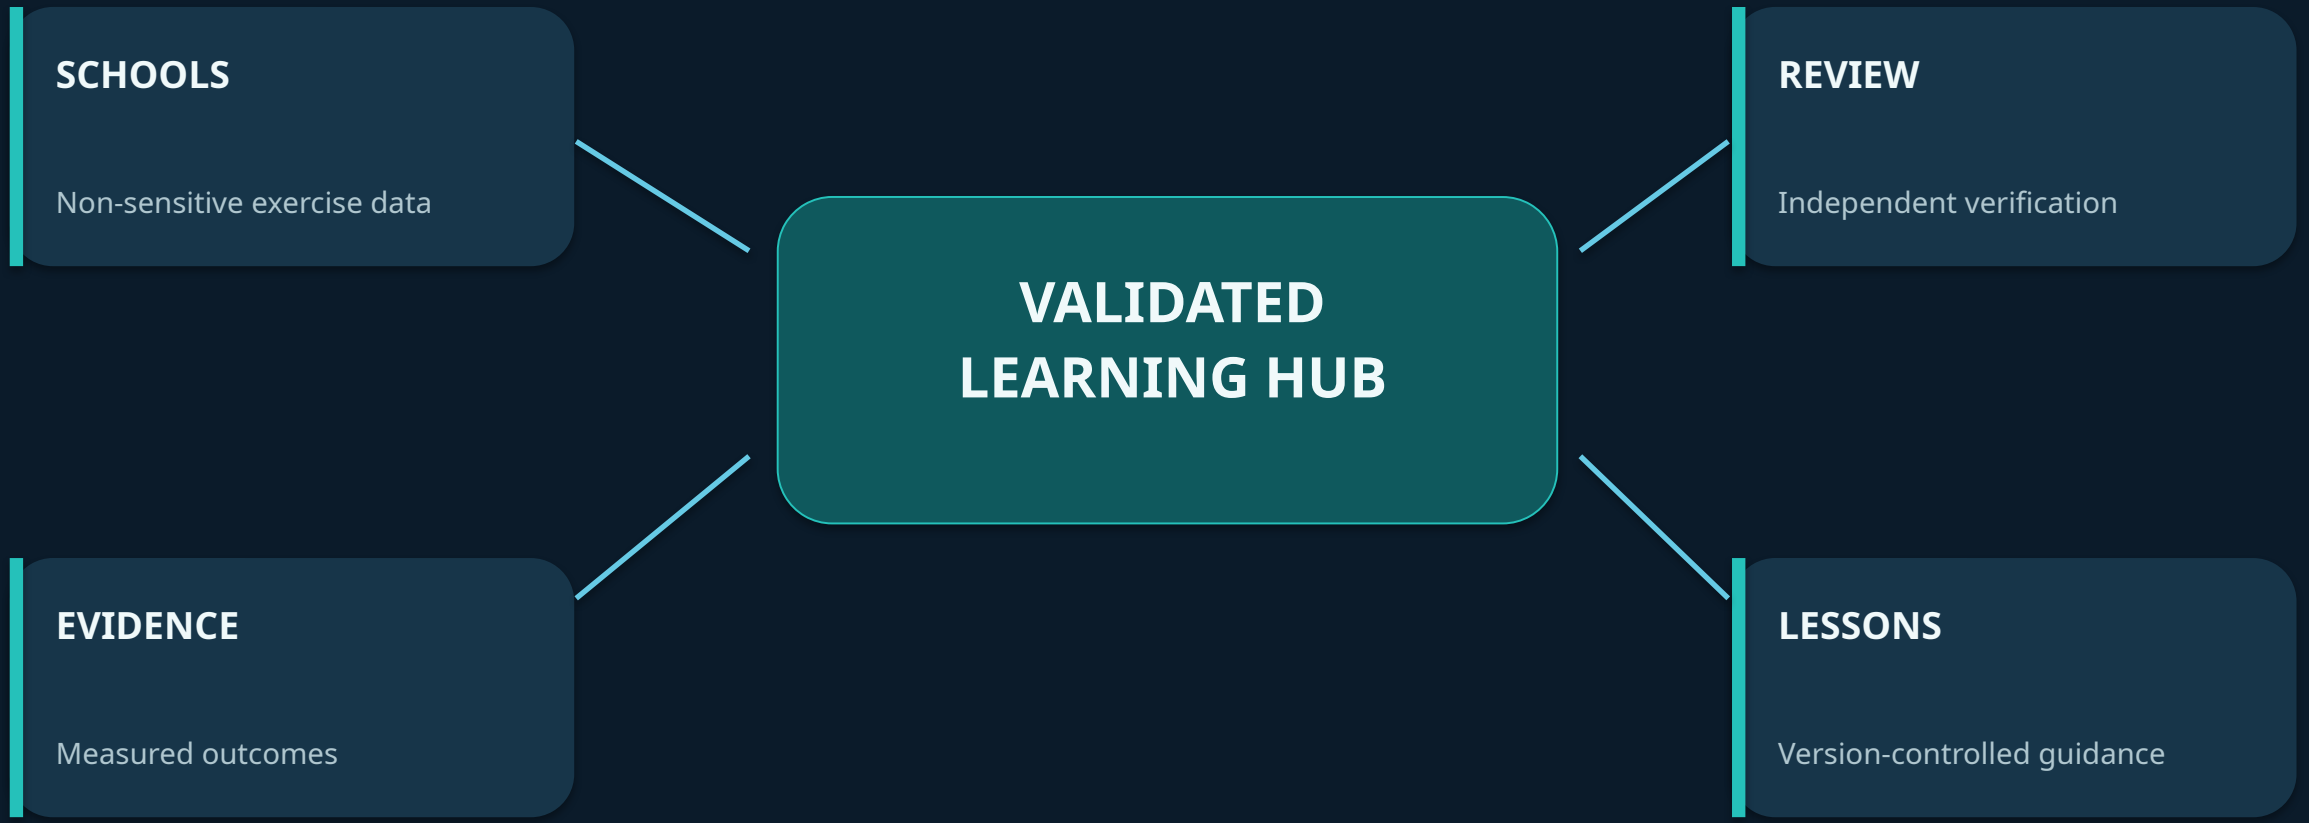

External route; preservation and remedies

OVERSIGHT

Public aggregate measures, non-retaliation

SHARED LEARNING / VERIFIED IMPROVEMENT

Publish aggregate, de-identified lessons—not sensitive campus vulnerabilities.

EXAMPLE: TRACE FROM SPECIFIC THREAT TO TEST

These four public examples demonstrate the acceptance logic; 18 full records accompany the proposal.

T01 · YOUTH ACCESS	Opt-in secure storage	Anonymous caregiver comprehension / adoption
T05 · FALSE TIP	Corroboration and correction	Synthetic false-report appeal exercise
T12 · SPOOFED ALERT	Cyber isolation + manual alert fallback	Authorized isolated failure injection
T13 · SEVERE BLEEDING	Kits + trained response	Skills check, stock and EMS handoff

QUALIFICATION IS AN EVIDENCE DECISION

A 90-day research pilot is not field certification of life-safety or armed-response capabilities.

DAYS 0–30

Baseline, authority and privacy review

DAYS 31–60

Synthetic drill, controlled outage and review

DAYS 61–90

Independent decision, publish aggregate results

APPROVE / PILOT WITH LIMITS / REMEDIATE / REJECT

Stop immediately for unlawful authority, unsafe egress or unreviewed use of force.

VERSION 17.0 / NEXT STEPS

The public engineering analysis is complete; field approval is not.

BOARD REVIEW & LOCAL VALIDATION

Select representative scenarios, identify accountable owners, verify law and fire-code requirements, measure baseline protection, and fund independent qualification testing.

Publish only de-identified results and avoid operationally exploitable security details.

Independent public research · GNU AGPLv3 · No live-site operational certification claimed
